Project Name	DocSpot : Seamless Appointment Booking for Health

Solution Architecture:

Solution architecture is a structured approach that defines how the proposed system solves the identified business problem using appropriate technologies and system design. It bridges the gap between business needs and technical implementation.

For the Doctor Appointment Booking System, the solution architecture includes the following:

1. Best Technical Solution to Solve the Business Problem

To eliminate long waiting times, manual booking errors, and poor appointment tracking, we propose a web-based centralized appointment management system built using:

Frontend: React.js (User Interface)

Backend: Node.js with Express.js (Server & API Handling)

Database: MongoDB (Cloud-based database)

Authentication: JWT (JSON Web Token)

Deployment: Cloud Hosting Platform

This ensures scalability, security, and real-time appointment management.
